### **REMOTE PROCEDURE CALL FOR SORTING AN ARRAY -XMLRPC AIM:**

To Implement an XML RPC code for sorting array

Algorithm:

#### **Algorithm**

#### **Server Program**

1. **Import Required Library:** Import the xmlrpc.server library, which provides functionalities for setting up an XML-RPC server.
2. **Define sort\_array Function:**
  - Define a function called sort\_array that takes a list (arr) as input. ○ Inside this function, return the sorted version of arr.
3. **Set Up Server:**
  - Create an instance of SimpleXMLRPCServer, specifying localhost as the host and 8000 as the port.
  - Print a message indicating the server is running.
4. **Register Function:**
  - Register the sort\_array function with the XML-RPC server under the name "sort\_array". This makes it available for remote calls.
5. **Run the Server:**
  - Call server.serve\_forever() to start the server and keep it running indefinitely, waiting for client requests.

#### **Client Program**

1. **Import Required Library:** Import the xmlrpc.client library to enable communication with the XML-RPC server.
2. **Connect to Server:**

- Create a ServerProxy object to connect to the server running on `http://localhost:8000`.

### 3. Prepare Input Array:

- Define an array `arr` with some integer values that will be sent to the server for sorting.

### 4. Call `sort_array` Method:

- Use the `server.sort_array()` function to send `arr` to the server for sorting.
- Store the result (sorted array) in a variable `sorted_arr`.

### 5. Display Results:

- Print the original `arr` and the `sorted_arr` to verify the sorting operation was successful.

## Program:

### SERVER PROGRAM: import

```
xmlrpc.server
```

```
# Function to sort the array
```

```
def sort_array(arr): return  
sorted(arr)
```

```
# Setting up the server with xmlrpc.server.SimpleXMLRPCServer  
as server: print("Server is running...")
```

```
# Registering the sort_array function as an XML-RPC method
```

```
server.register_function(sort_array, 'sort_array')  
server.serve_forever()
```

### CLIENT PROGRAM:

```
import xmlrpc.client
```

```
# Connect to the server server = xmlrpc.client.ServerProxy('http://localhost:8000')
```

```
# Input array to be sorted arr
= [12, 4, 5, 3, 7, 2]

# Calling the sort_array method on the server sorted_arr
= server.sort_array(arr)

# Displaying the result print("Original
Array:", arr) print("Sorted Array:",
sorted_arr)
```

## Output

### SERVER OUTPUT

```
"C:\Users\Kaviya V\PycharmProjects\pythonProject2\.venv\Scripts\python.exe"
Server is running...
```

### CLIENT OUTPUT

```
"C:\Users\Kaviya V\PycharmProjects\pythonProject2\.venv\Scripts\python.exe"
Original Array: [12, 4, 5, 3, 7, 2]
Sorted Array: [2, 3, 4, 5, 7, 12]

Process finished with exit code 0
```

## RESULT:

Procedure call for sorting an array - XMLRPC remoted.
